

## HIGH-RISK PATIENT WITH GROWING SACCULAR ANEURYSM RECEIVES SUCCESSFUL TREATMENT IN TRIOMPHE STUDY

## PATIENT INFORMATION

A 76-year-old female with a history of COPD, smoking, Type 2 diabetes, carotid artery disease, had a CVA in 2016.

The patient presented with a large growing saccular aneurysm of the aortic arch with a max diameter of 9.2 mm. After reviewing her CT and discussing options, the patient elected to be treated with the NEXUS™ Aortic Arch Stent Graft System as part of the TRIOMPHE IDE Study.

The aortic arch debranching was performed via a partial upper sternotomy. A left to right carotid-carotid transposition was performed, followed by a left carotid to left subclavian bypass utilizing a 7 mm ringed ePTFE.

NEXUS™ was successfully implanted during an uneventful procedure with an optimal outcome, at a total device time of 88 minutes.

## PROCEDURAL OUTCOME

A one month follow-up CT showed a stable position of NEXUS™ and no endoleak identified.
